

Connectivity Readiness Assessment

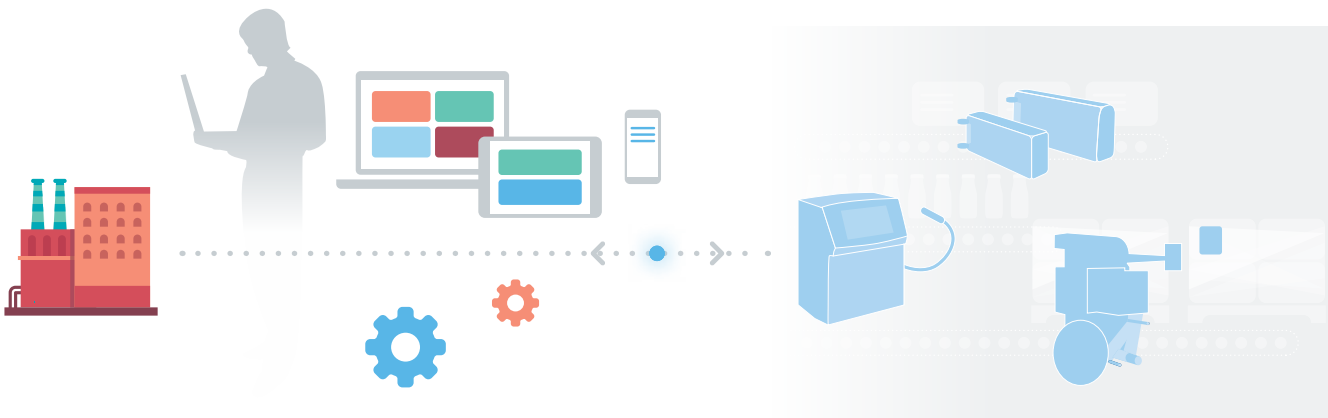

Is a centralized printer management software right for my operation? Answer the True / False statements below to assess your readiness for implementing a connectivity software to streamline your operations.

CHOOSE WHETHER OR NOT THE STATEMENTS ARE TRUE OF YOUR OPERATION.

TRUE

FALSE

Print message information gets manually entered before every production run.		
Three or more production lines with coding equipment on each line.		
Consumable levels are checked at each individual printer/labeler.		
Managing 20 or more product SKUs.		
Coding input errors routinely lead to rework or scrap.		
There is little to no notice before a line shuts down due to printer maintenance.		
TOTALS		

How to Read Your Results

0-1

✓ TRUE STATEMENTS

Your material handling is likely already a well-oiled machine with automation in place for efficient production and optimal uptime results.

Even if you are getting by without a centralized dashboard with all your print messages and alerts in one place, you may consider researching your options for future growth and expansion when manual monitoring would become more of a burden.

2-3

✓ TRUE STATEMENTS

Centralizing your print messages, maintenance alerts and history could take your operation to the next level. Your processes are complex, so have the confidence and peace of mind that everything in your facility is running smoothly.

Over the next 6 months you might want to consider a printer management solution to streamline your coding operations for max efficiency.

4 OR MORE

✓ TRUE STATEMENTS

A fear of the wrong message selection for a printer run or coders going offline without your knowledge are commonplace. Human error and wasted time monitoring at an individual printer level should not be a reality. There is waste in your operation – and lots of opportunity for improvement!

Your coding operation could do a 180 with a printer management software in place.
